

Breaking Language Barriers

- Workshops run across languages every day.
- When facilitator and learner don't share one, a lost learner stays quiet.
- By the time anyone notices, the moment to help is gone.

We capture speech, translate it live, and have Claude track the goal, decisions, and blockers from the transcript — every insight linked back to the exact line it came from.

Facilitator dashboard

- The goal comes from setup. Nothing else.
- Decision and blocker cards? No one typed them.
- Claude pulls them live from the transcript — and cites the line, or rejects itself.

WORKSHOP GOAL

Implement a working REST endpoint for user signup, including input validation.

LEARNERS JOINED

0

Learners have completed consent and joined.

Evidence-backed intervention queue

BLOCKER

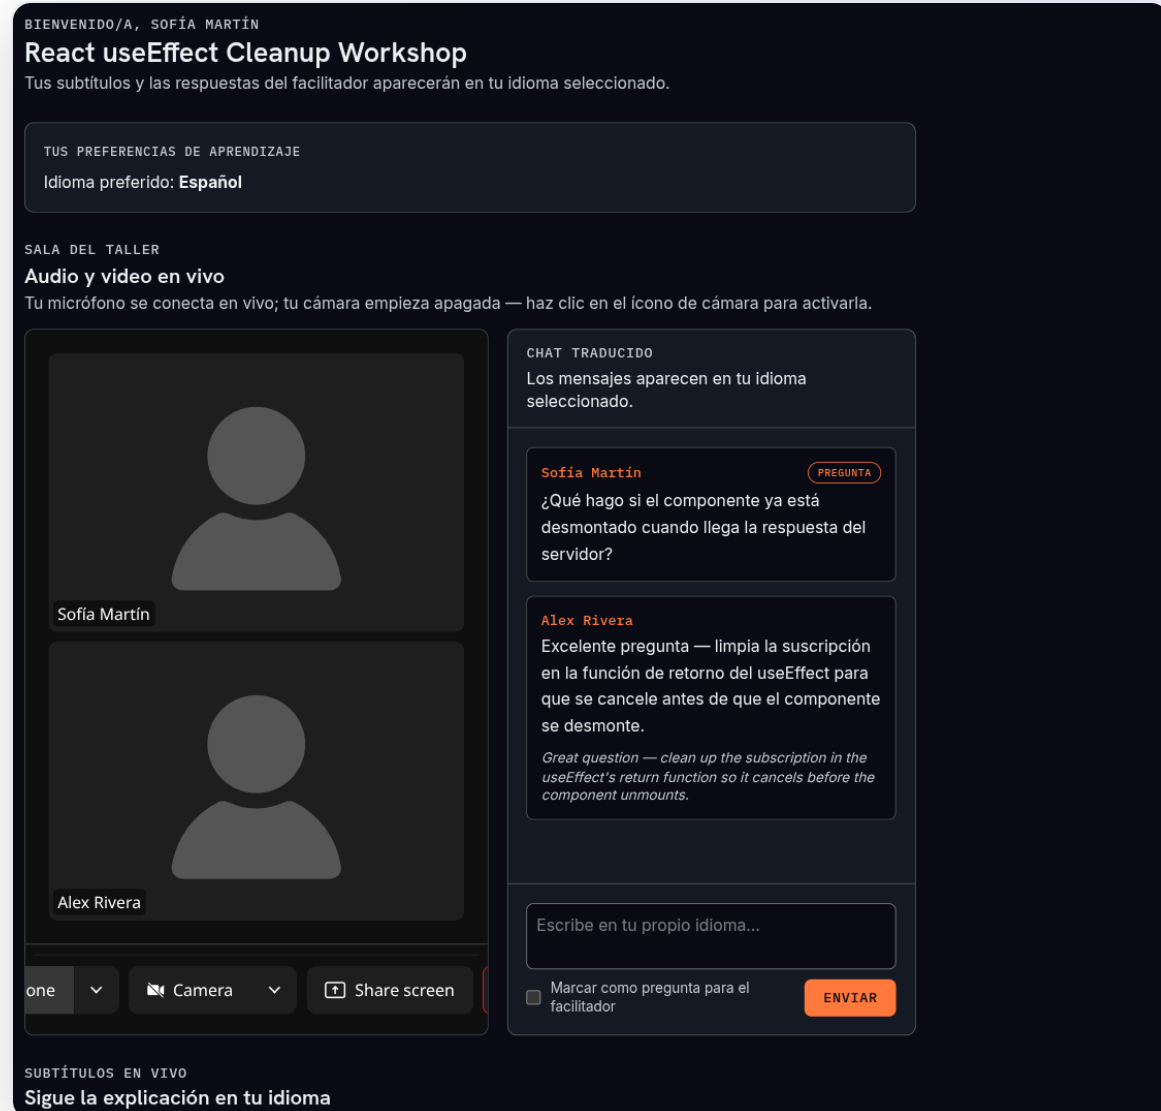

500 error persists on missing email field despite implementing early return for validation — root cause unknown

"Let's keep digging into why the 500 error still happens even with the early return in place."

Suggested action: ask the group to test whether `validateEmail()` throws.

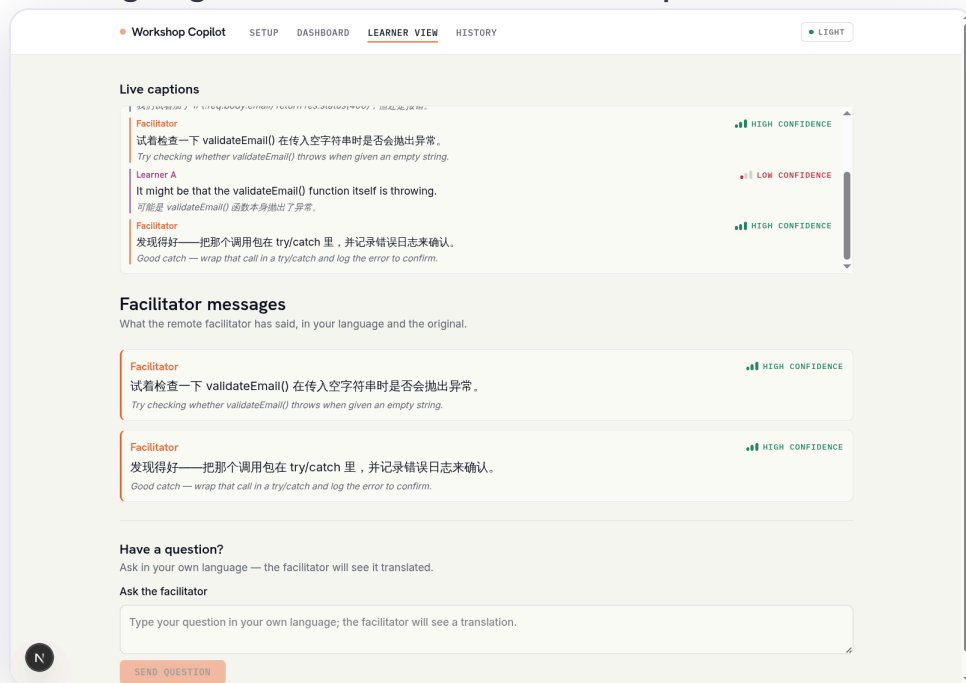

Join as a learner, ask a question, get a translated reply

- Scan a QR code. No account, no setup.
- Captions translate in real time — original still visible underneath.
- A question arrives already translated. The reply translates back.
- Every screen, every button — fully localized.

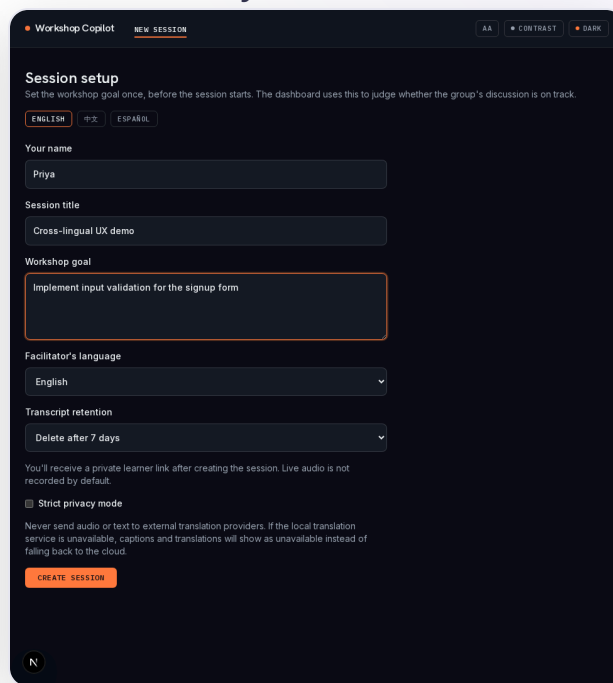

Accurate, accessible, and privacy-respecting by design

- The brief asks for speed, accuracy, accessibility, privacy — not just a demo.
- Every caption carries a confidence score. Shaky translations get flagged, not trusted blindly.
- Text size, high contrast, light or dark — every screen, every session.
- Languages and retention are set up front. Audio is never recorded by default.

Live captions with per-line confidence

Languages, retention & privacy set at session start

Accessibility controls

Grounded by design, real today

Impact

A quiet learner used to be invisible. Now it's a card on the dashboard, translated round-trip, in a session that ships fully localized end to end.

Prototype quality

Real Postgres sessions, role-scoped join tokens, accessibility and i18n baked in from setup through Q&A — not a slide.

Feasibility

A citation guardrail
(`validateInsightDraft`) on top of Deepgram and Claude — APIs we can call today.

Thank you — live translation plus grounded understanding, so no one gets left behind in their own workshop.
