

Breaking Language Barriers

Online workshops run across languages every day. When facilitator and learner don't share one, a lost learner usually stays quiet — by the time anyone notices, the moment to help has passed.

We capture speech, translate it live, and have Claude track the goal, decisions, and blockers from the transcript — every insight linked back to the exact line it came from.

Facilitator dashboard

The goal comes from setup. Decision and blocker cards weren't typed by anyone — pulled live by Claude from the transcript, each one linked back to the exact line it came from and rejected if it isn't.

WORKSHOP GOAL

Implement a working REST endpoint for user signup, including input validation.

LEARNERS JOINED

0

Learners have completed consent and joined.

ACT NOW

Evidence-backed intervention queue

BLOCKER

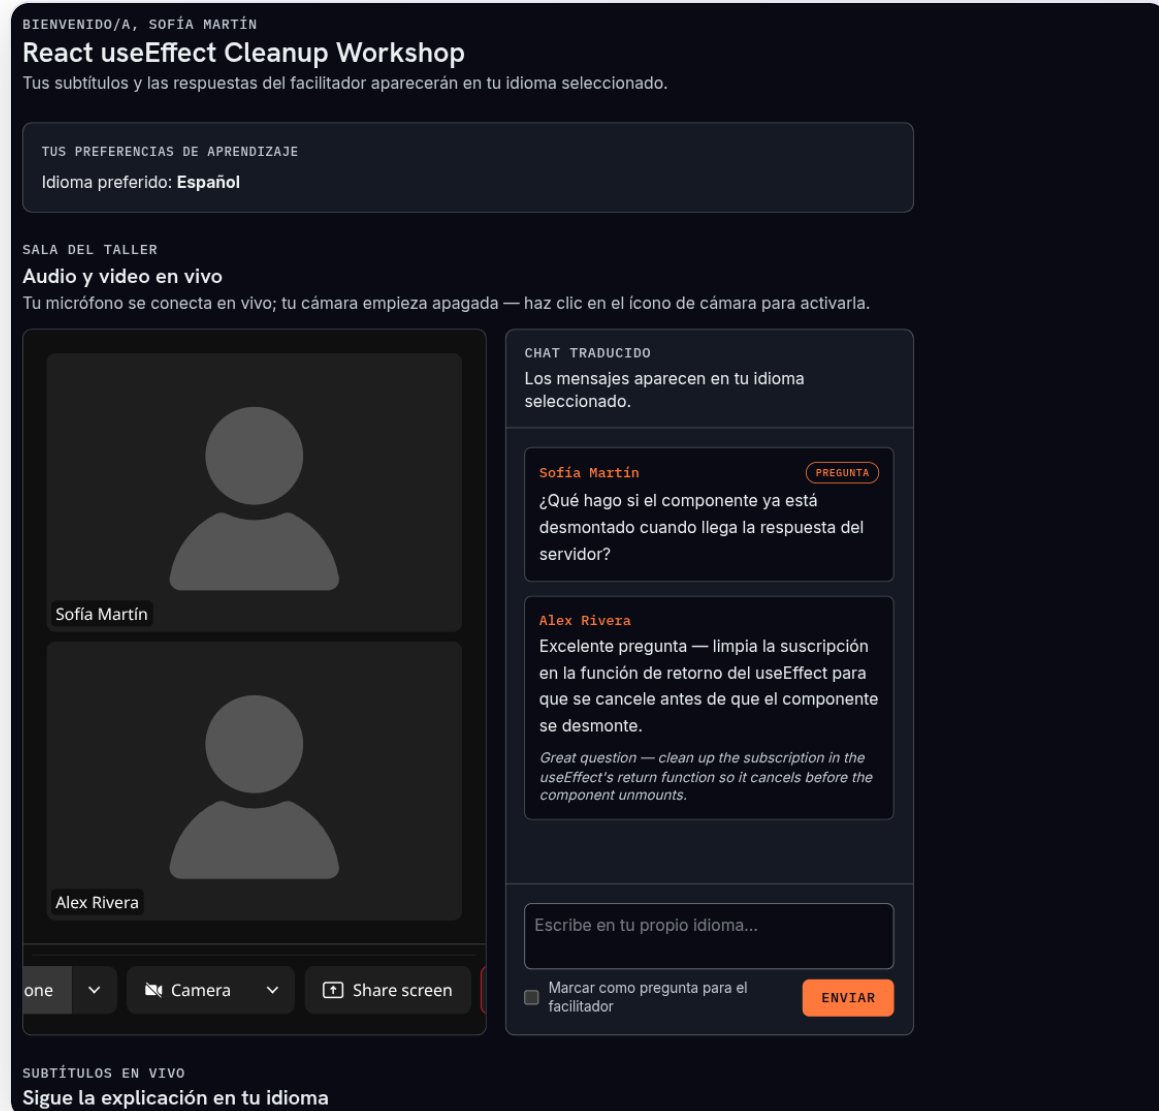

500 error persists on missing email field despite implementing early return for validation — root cause unknown

"Let's keep digging into why the 500 error still happens even with the early return in place."

Suggested action: ask the group to test whether `validateEmail()` throws.

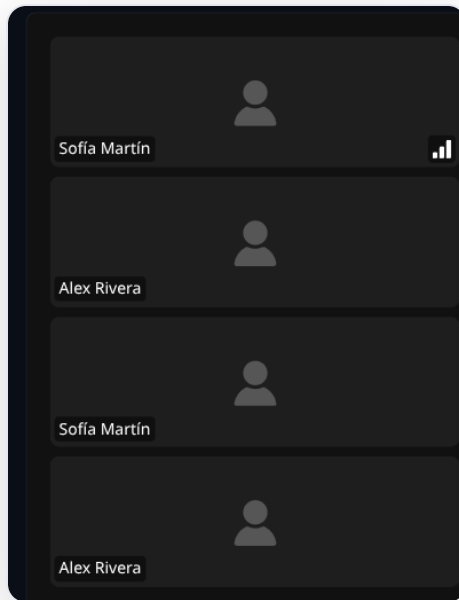

Join as a learner, ask a question, get a translated reply

Scan a QR code, no account setup.
Live audio/video, captions translated in real time with the original still visible. A learner's question lands on the facilitator's side already translated — the reply auto-translates back. This whole flow, chrome included, runs fully localized.

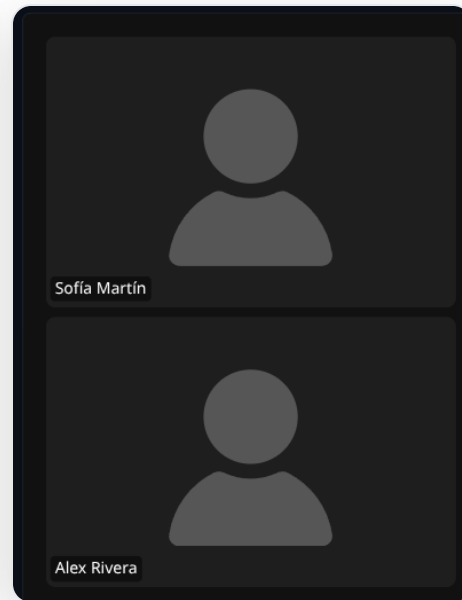

Built for real sessions, not just a demo

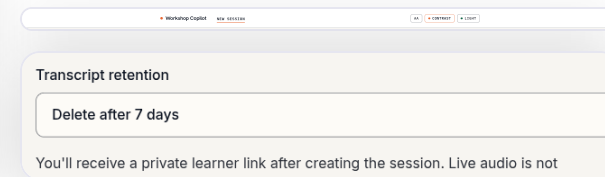

A UAT pass caught and fixed a video-tile duplication bug (4 tiles for 2 participants) before it shipped. Every screen ships with adjustable text size, a high-contrast theme, and light/dark mode. Facilitators choose how long transcripts are kept — deleted automatically once that window passes.

Before — 4 tiles for 2 participants

After — fixed

Accessibility controls & retention setting

Grounded by design, real today

Impact

A quiet learner used to be invisible. Now it's a card on the dashboard, translated round-trip, in a session that ships fully localized end to end.

Prototype quality

Real Postgres sessions, role-scoped join tokens, three UAT rounds of accessibility and i18n fixes — not a slide.

Feasibility

A citation guardrail
(`validateInsightDraft`) on top of Deepgram and Claude — APIs we can call today.

Thank you — live translation plus grounded understanding, so no one gets left behind in their own workshop.
